

# Week-Over-Week — what running ads changed

Generated 2026-05-19 · this week = 2026-05-13 → 2026-05-19 · prior week = 2026-05-06 → 2026-05-12 · context: findings have not yet been shared with the buying team, so this is a pure observation of what the day-to-day buyer chose on their own signals

Raw output: [out/week\\_over\\_week\\_2026-05-19.txt](#)

## TL;DR

- **Total weekly spend fell from 138.9M → 73.9M VND (–47%).** Not gradual; it came from campaign-level pauses.
- **147 ads stopped spending entirely vs prior week.** Almost all carry status `CAMPAIGN_PAUSED` — entire campaigns got paused, sweeping up winners and losers together. Worth confirming whether this was an intentional budget cut or a one-time event (release freeze, account review, etc.).
- **Only 1 new ad launched** ( `3-RLTH` , ROAS 1.16).
- **The remaining ~55 active ads got their spend concentrated** — 24 of them scaled  $\geq 2\times$  or +500k week-over-week.
- **Among those scale-ups, the buyer is feeding ~5M VND/wk into ads currently at 0.00–0.5 ROAS** ( `17x-kv` , `45-xpage-kv` , `code86-reup` , `code118-xpage` , `code13-reup`  $\times 3$  , `code83-x3` , `cx93-3` ). The buyer hasn't seen our ROAS analysis yet, so they're picking based on different signals (probably CPL/lead volume from the Meta-side data) — once findings are shared, those calls should self-correct.

## What got pruned (147 stopped ads — mostly campaign-level pauses)

Mix of good and bad — entire campaigns were paused regardless of code-level performance. Winners that got swept up:

| Code                      | ROAS | Stopped spend (prior wk) | Notes                                      |
|---------------------------|------|--------------------------|--------------------------------------------|
| <code>code15_xpage</code> | 1.98 | 1.97M                    | Top-5 ROAS code, now stopped               |
| <code>code128</code>      | 1.51 | 1.66M                    | SCALE-grade winner                         |
| <code>intro2-xpage</code> | 1.50 | 1.64M                    | One instance stopped (others still active) |
| <code>13-xpage-kv</code>  | 1.43 | 2.02M                    | One instance stopped (one still active)    |
| <code>code45-xp</code>    | 1.43 | 1.93M                    | One instance stopped                       |
| <code>code63-3</code>     | 1.20 | 1.32M                    | HOLD-grade, stopped                        |
| <code>code13_xpage</code> | 1.17 | 1.59M                    | One instance stopped                       |

Losers that got pruned (expected): `code17-xpage`  $\times 3$  (0.19), `code43-xp` (0.36), `ct19-reup` (0.31), `code83-xp` (0.21), and many more.

Same codes appear under both "stopped" and "scaled up" because they had multiple ads across campaigns; some campaigns paused, others continued.

## What got scaled up (24 ads, +25.4M wow)

### Scale-ups on confirmed-winning codes

| Code                              | ROAS        | $\Delta$ wow | This wk |
|-----------------------------------|-------------|--------------|---------|
| intro2-xpage (×2 active)          | 1.50        | +2.98M       | 3.86M   |
| code45-xp                         | 1.43        | +1.51M       | 1.90M   |
| 13-xpage-kv (one active instance) | 1.43        | +1.58M       | 2.01M   |
| code13_xpage                      | 1.17        | +1.50M       | 1.89M   |
| code14-xpage                      | 1.07        | +394k        | 677k    |
| ct19-xpage                        | 1.32        | +257k        | 484k    |
| cx-94                             | <b>3.24</b> | +320k        | 418k    |
| code85-reup                       | 1.27        | +529k        | 833k    |

### Scale-ups on codes that are losing on ROAS

These are the codes most likely to need a re-look once findings are shared:

| Code             | ROAS        | $\Delta$ wow | This wk                                 |
|------------------|-------------|--------------|-----------------------------------------|
| 17x-kv           | <b>0.00</b> | +1.18M       | 2.13M                                   |
| 45-xpage-kv      | 0.24        | +1.56M       | 1.98M                                   |
| code86-reup      | <b>0.00</b> | +730k        | 760k                                    |
| code118-xpage    | <b>0.00</b> | +427k        | 614k                                    |
| code13-reup (×3) | 0.57        | +4.67M       | 5.82M                                   |
| code83-x3        | 0.56        | +1.38M       | 1.71M                                   |
| cx93-3           | 0.53        | +1.10M       | 1.31M                                   |
| ct19             | 0.46        | +1.38M       | 1.71M                                   |
| ct6              | 0.37        | +1.50M       | 1.96M (status: CAMPAIGN_PAUSED already) |

These all likely look acceptable on the Meta-side metrics the buyer can see (CPL, click volume, lead count) — the gap only opens up once you join Meta spend to Getfly *paying* revenue, which is what this repo's pipeline does. Once the buyer has visibility on which leads actually pay, these calls should change.

### Still-active engagement-objective ads (3 instances of Quảng cáo Lượt tương tác mới )

Three active ads, ~2.87M VND/week (~11.5M/mo run-rate), ROAS 0.00 on paid-customer attribution.

These are the engagement-objective IKMC vinh-danh creatives — they're not designed to capture leads, so the 0.00 is by design. Open question carried from the original audit: **does the org actually value the IKMC**

**engagement these generate, or should this campaign be paused?** Needs the brand-awareness/engagement-KPI decision flagged in CLAUDE.md before pause/keep makes sense.

---

## Things to confirm with the team

---

1. **Was the 47% spend cut intentional?** If yes (budget freeze, mid-month review, etc.), that frames the rest of this. If no (collateral from pausing specific campaigns), then we have a different question about which campaigns to re-enable.
  2. **Were the campaign-pauses on `code15_xpage` (1.98), `code128` (1.51), `code63-3` (1.20) intentional?** If they came from pausing a parent campaign that contained mixed codes, the winners should be moved into a fresh campaign and re-enabled.
  3. **Does the buyer want a regular share of ROAS data?** They're optimizing on Meta-side metrics; the ROAS/Getfly join is the missing layer. Daily/weekly automated share of `out/actionable_*.txt` would close the gap.
  4. **The IKMC engagement campaign** — still needs the brand-vs-direct-response KPI decision.
